

What Rever is: agentic AI for finance and accounting

Agentic AI for finance and accounting: Eve and fifteen specialist agents do the finance work, and your team keeps the final say.

Published 12 October 2026

Rever puts AI agents to work on the procedures your finance team already runs on its ledger: reconciliations, verifications, controls and the close. Rever describes itself as agentic AI finance automation, built by finance, for finance, and puts the division of labour in one line: "Rever's AI finance agents do the work. Your team keeps the final say." Eve, Rever's agentic finance manager, coordinates fifteen specialist agents in five work groups. Rever's roster of [AI agents for finance](#) lists each agent and what it may do.

Agentic AI for finance and accounting, in five work groups

Recover value and protect profit. Entitlement finds the rebates, credits and discounts a contract says are due and assembles the claim. Deduction tests short payments against invoices, agreements and delivery evidence. Spend Guard checks for duplicate invoices and payments and for price drift, and Revenue Assurance checks that delivered work is billed as agreed.

Verify the transaction. Matcher reconciles related records across contracts, orders, invoices, payments and ledgers, including [continuous bank reconciliation](#). Investigator traces each difference Matcher cannot explain to its root cause.

Keep the books and close moving. Journal prepares supported journals, accruals and reversals. Close Orchestrator keeps tasks, reconciliations and sign-offs moving all month, with blockers in view. Flux Analyst ties each movement to the transactions behind it.

Improve cash visibility and evidence. Cash Pilot builds a 13-week cash forecast and Inventory reviews stock existence, cut-off and valuation. Evidence keeps the original records connected to every workpaper.

Keep the agent team accountable. Sentinel flags suspicious vendor-bank changes and payment patterns. Steward watches for stale data and failed syncs, and Auditor tests whether the agents followed their approved procedures.

How the work reaches you

Rever connects read-only to NetSuite, Dynamics 365, QuickBooks, Stripe, your banks and your documents, and checks 100% of in-scope transactions instead of a sample. Eve first builds the business context: your business model, systems, commercial terms and accounting policies. Each

agent then follows the SOP your team approved.

Findings, questions and approvals land in your Inbox with their evidence and financial significance. Rever never writes to your systems: only work a person with the authority approves leaves Rever, and you set the approval thresholds and dual approval for material amounts. A new agent starts as an observer, and Eve promotes what performs and demotes what does not. Rever runs in its managed cloud, in a private cloud or self-hosted in your environment.

Five outcomes and the honesty ratio

Rever's Home keeps five outcomes apart: value identified, value recovered, leakage prevented, cash released and errors corrected. Identified value is a supported opportunity that still needs validation or action. Recovered value is verified cash received or a credit applied.

rever.ai illustrates [value recovery](#) with a rebate, labelled as an example and not a customer result: \$1,200,000 of eligible purchases at a 2% contractual rebate is \$24,000 of potential recovery. Entitlement checks the contract, Evidence links the support, your team approves the claim, and Rever tracks it until the cash arrives or the credit is applied. Until then, the \$24,000 sits in the identified column.

Hold Rever to the honesty ratio it reports, value recovered divided by value found, on your own data.

Your first step is [the zero-day scan](#), the first pass over your connected records once read-only access is in place. The free tier runs it self-serve: Try Rever Free at [console.rever.ai](#) connects read-only, scans the data you connect and lets Eve answer questions about it, with unlimited users on Rever's managed cloud. The free Proof of Value runs the same scan on a limited period of your data and walks you through the findings.

Questions

What is agentic AI for finance and accounting?

Agentic AI for finance and accounting means software agents that carry out defined finance procedures, such as matching transactions to their documents, preparing journals or assembling a rebate claim, and hand the result to a person to approve. In Rever, Eve coordinates fifteen such agents, each with a published scope, and every decision waits for approval in your Inbox.

Do AI agents post journal entries in Rever?

No. Rever never writes to your systems. Journal prepares the entry with its support, a person with the authority approves it in the Inbox, and the approved entry comes back as an import file your team loads, a .qbo file for QuickBooks today. Journal checks the resulting record and cannot approve its own entry. Eve cannot post journals at all.
